### The Project (continued from previous lecture)

7. Users are resistant.
8. Sponsorship is lost
9. The project team lacks people with appropriate skills.
10. Managers avoid best practices and lessons learned.

### Solution to avoid the problems:

1. Start on the right foot: Working hard to understand the problem that is to be solved and then setting realistic goals
2. Maintain Momentum: Many projects get off to good start and then slowly disintegrate. The project manager must provide incentives to keep turnover of personnel to minimum and emphasize on quality.
3. Track progress: Progress should be tracked as work products are produced and approved.
4. Make smart decisions: The decisions of the project manager and the software team should be to "keep it simple". Decide to identify and avoid obvious risks.
